

Web Based Accounting System

Minor Project-II

(ENSI252)

Submitted in partial fulfilment of the requirement of the degree of

BACHELOR OF TECHNOLOGY

to

K.R Mangalam University

by

Raghav Kumar Jha (2301010260)

Khushi Swarna (2301010228)

Ujjwal Prakash Singh(2301010234)

Under the supervision of

Dr. Aman Jatain
Professor

Mr. Sudhir Singh Chauhan
Director
Agraj Infrastructure Private Limited

Department of Computer Science and Engineering

School of Engineering and Technology

K.R Mangalam University, Gurugram- 122001, India

April 2025

CERTIFICATE

This is to certify that the Project Synopsis entitled, “**Web Based Accounting Sysytem**” submitted by “**Raghav Kumar Jha(2301010260), Khushi Swarna (2301010228) and Ujjwal Prakash Singh(2301010234)**” to **K.R Mangalam University, Gurugram, India**, is a record of bonafide project work carried out by them under my supervision and guidance and is worthy of consideration for the partial fulfilment of the degree of **Bachelor of Technology in Computer Science and Engineering** of the University.

ABSTRACT

In the digital age, managing financial records efficiently and accurately has become crucial for individuals and organizations alike. Traditional methods of accounting, which often rely on manual data entry and paper-based records, are time-consuming, error-prone, and lack real-time accessibility. To address these challenges, this project introduces **AccuLedger**, a user-friendly and secure web-based accounting system designed to streamline financial management through automation, centralization, and intelligent data handling.

AccuLedger enables users to seamlessly record, track, and analyze income, expenses, and invoices through an intuitive graphical interface. The system is built using modern web technologies including HTML, CSS, JavaScript, PHP, and MySQL, ensuring cross-platform compatibility and real-time updates. Key features include user authentication, dynamic data visualization, ledger management, invoice generation, and report creation. The backend logic ensures data integrity and security, while the frontend prioritizes usability and responsive design.

This project demonstrates how a tailored web application can simplify financial workflows, enhance accuracy, and reduce operational overheads, especially for startups, small businesses, and independent professionals. Through AccuLedger, we aim to bridge the gap between traditional bookkeeping and modern digital finance solutions, offering a reliable and scalable system for everyday accounting needs.

KEYWORDS: Accounting System, Web Application, Financial Management, Ledger, Invoice, PHP, MySQL

Chapter 1

Introduction

1. Background of the project

In today's dynamic business environment, managing financial data accurately and efficiently has become a fundamental necessity for organizations of all sizes. Traditional bookkeeping methods, involving physical records and manual entry, have proven to be increasingly outdated in the face of rapid digital transformation. Errors in calculation, difficulty in record retrieval, lack of security, and time-consuming processes are just a few challenges that arise from these older systems.

Furthermore, small and medium enterprises (SMEs), startups, and even independent professionals often lack the resources to invest in high-end ERP solutions, yet still require a robust platform to manage accounts, track income and expenses, and generate financial reports. The COVID-19 pandemic further accelerated the need for remote access to financial systems, as physical handling of documents became increasingly impractical. Businesses worldwide realized the importance of having reliable, accessible, and automated accounting tools to ensure continuity and financial transparency.

To bridge this gap, we have developed **AccuLedger**—a secure, scalable, and user-friendly web-based accounting system. This system empowers users to perform essential accounting tasks including ledger management, income/expense tracking, invoice generation, and reporting through an intuitive GUI. Designed using technologies such as PHP, MySQL, HTML, CSS, and JavaScript, AccuLedger provides real-time access, role-based security, and a responsive interface adaptable across devices.

The following table compares the features of common accounting systems and how AccuLedger addresses these needs more comprehensively:

Table 1: Comparison of Existing Accounting Systems

Factors	Evaluation Criteria	System A	System B	AccuLedger
Data Management	Multi-user support	Yes	No	Yes
	Real-time transaction logging	No	Yes	Yes
Usability	Responsive web interface	No	Yes	Yes
	Easy report generation	Moderate	Good	Excellent
Security	Role-based access	No	Yes	Yes
	Data encryption	Limited	Moderate	Strong
Integration & Compatibility	Integration with other apps	Moderate	Limited	API-ready
	Export to Excel/PDF	Yes	Yes	Yes
Scalability	Handle increasing data volume	Limited	Moderate	Highly Scalable
Maintenance & Setup	Setup time and ease	Long	Moderate	Quick & Simple
	Required technical knowledge	High	Moderate	Low (User-Friendly)
Cost	Licensing & operational cost	High	High	Low (Open Source)
Reporting & Audit	Monthly/Quarterly/Annual reports	Limited	Yes	Yes + Customizable

Through this project, we aim to eliminate the pain points of traditional accounting systems by offering a solution that is accessible, transparent, and tailored for real-world use in various domains—from educational institutions and NGOs to local businesses and freelancers.

2. MOTIVATION

In the modern digital economy, managing financial data with accuracy, accessibility, and efficiency is more important than ever. Many startups, small businesses, educational institutions, and even individual professionals still rely on outdated bookkeeping practices, such as handwritten ledgers or static spreadsheets. These traditional methods are time-consuming, prone to human error, and often lack proper data security and accessibility.

As financial operations grow more complex and businesses adopt remote or hybrid working environments, the need for centralized, automated, and secure accounting solutions has become increasingly urgent. The COVID-19 pandemic further highlighted the importance of cloud-based and real-time financial tools, as organizations faced challenges managing accounts and records remotely.

Moreover, the financial landscape demands transparent, audit-ready systems to avoid discrepancies and ensure compliance with regulations. However, existing professional-grade accounting software can be costly, complex, and not suitable for smaller teams or individual users.

This gap in the market inspired us to develop **AccuLedger**, a smart, scalable, and user-friendly **web-based accounting system** that empowers users to track income, manage expenses, generate invoices, and view financial summaries through an intuitive interface. Built using modern technologies like **PHP, MySQL, JavaScript, and Bootstrap**, the platform simplifies the accounting process while maintaining strong data integrity and security.

Our project aims to democratize financial management by offering a solution that is accessible, adaptable, and affordable—bridging the gap between manual processes and enterprise-level software. With features like role-based login, real-time data updates, and exportable reports, AccuLedger strives to become a go-to tool for individuals and organizations looking to streamline their financial workflow.

Chapter 2

LITERATURE REVIEW

1. Review of existing literature

CLOUD-BASED ACCOUNTING SYSTEMS:

The growing adoption of cloud computing has enabled accounting software to become more accessible and efficient. In a study conducted by Wang et al. [5], cloud-based accounting systems were shown to significantly reduce operational costs for SMEs while improving accessibility and data integrity. These systems allow real-time collaboration and remote access, providing businesses with up-to-date financial insights without being tied to a physical location. Security concerns, initially considered a barrier, have been largely mitigated through encryption and secure server protocols.

WEB-BASED FINANCIAL TRACKING PLATFORMS FOR SMEs:

Research by Gupta and Malhotra [4] emphasized the role of tailored financial platforms in helping small enterprises manage transactions and generate reports efficiently. Their study highlighted the importance of user-friendly interfaces and modular features like income/expense tracking, invoicing, and tax calculations in increasing user engagement and accuracy. The integration of PHP and MySQL was common in lightweight, budget-friendly platforms suited for Indian SMEs.

DIGITAL LEDGERING USING OPEN SOURCE TECHNOLOGIES:

An open-source solution study by Kumar et al. [2] explored how MySQL-PHP based ledger management tools were being increasingly used in educational institutes and NGOs due to their ease of deployment and maintenance. The study concluded that such systems offer a cost-effective and scalable alternative to licensed ERP solutions and are ideal for environments with constrained technical support resources.

INTEGRATING GUI IN ACCOUNTING APPLICATIONS:

A research conducted in [3] by Sengupta et al. focused on GUI-based financial applications and found that visual interfaces significantly reduced the learning curve for non-technical users. Tools like Tkinter (for desktop) and Bootstrap (for web) were instrumental in achieving intuitive dashboard layouts that improved user interaction and data entry efficiency. The study recommended that systems for decentralized usage should be built with minimalistic, mobile-responsive designs for better usability.

SECURITY IN ONLINE ACCOUNTING TOOLS:

A paper from the International Journal of Cyber Security [9] emphasized that the biggest challenge in digital accounting systems is data security. It compared multiple open-source frameworks and encryption protocols used in cloud-hosted accounting solutions. Proper access control, SSL encryption, and secure authentication layers were deemed essential for any accounting system that manages sensitive financial data over the web.

Table 2: LITERATURE REVIEW / COMPARATIVE WORK

Project Title	Objectives	Technologies Used	Outcomes and Findings
QuickBooks Online	Cloud accounting for small businesses	for Cloud, APIs, Real-time Syncing	User-friendly, good integrations, but high subscription fees
Tally ERP 9	Enterprise-level accounting management	Local software, proprietary system	Comprehensive, but requires training and is costly
GNUCash	Open-source accounting for individuals	GTK, SQL, XML	Free and effective, but lacks cloud features
LedgerSMB	Open-source ERP/Accounting system	Perl, PostgreSQL	Modular and scalable for SMEs, needs technical setup
AccuBooks Lite (case study)	Basic web-based ledger for school accounting	PHP, MySQL, Bootstrap	Improved ledger accuracy and report generation

Project Title	Objectives	Technologies Used	Outcomes and Findings
BizTrack ERP	Accounting and inventory for small retailers	PHP, JavaScript, MySQL	All-in-one solution, but requires server setup and updates
Xero	Cloud-based accounting with mobile support	Cloud, OAuth, HTML5	Excellent UX and mobile access, but lacks customization options
MyBooks (Zoho)	India-specific accounting software	Cloud, GST-compliant APIs	Tailored for Indian market, intuitive but limited free version

This literature review demonstrates the evolution of financial systems from traditional methods to scalable, web-based accounting tools. The references help justify the development of **AccuLedger**, which seeks to combine the strengths of flexibility, simplicity, and affordability in a single platform for modern users.

2. GAP ANALYSIS

Through a review of existing financial management tools and accounting platforms, it becomes evident that while there are numerous solutions available in the market, a significant gap persists in terms of accessibility, simplicity, and affordability—particularly for small businesses, educational institutions, and independent professionals.

Enterprise-level accounting software such as Tally, QuickBooks, and Zoho Books offer comprehensive features but are often complex, expensive, or require dedicated training and IT infrastructure. On the other hand, open-source solutions like GnuCash or LedgerSMB provide cost-effective alternatives but may lack the intuitive interfaces and modern web capabilities needed by today's users. Additionally, most systems focus heavily on either corporate-level accounting or personal finance, leaving a usability and feature gap in the middle tier.

Another major concern in existing tools is the lack of customization and modular integration. Many systems do not offer flexibility in features such as dynamic ledger creation, invoice templating, or exportable financial summaries, which are critical for adaptability across different use cases.

AccuLedger addresses this gap by offering:

- A lightweight, **web-based platform** built with PHP and MySQL for easy deployment and scalability
- A **clean and responsive GUI** using Bootstrap and JavaScript for smooth user experience
- Features like **user authentication, real-time transaction recording, ledger summaries, and invoice generation**
- Compatibility with multiple devices and browsers, enabling cross-platform accessibility

By focusing on the everyday financial needs of grassroots users and removing the complexity associated with traditional accounting tools, AccuLedger bridges the usability gap between enterprise-grade systems and manual accounting practices. The system is simple enough for non-technical users yet powerful enough to support real-time operations and financial reporting.

3. PROBLEM STATEMENT

In the current business landscape, managing financial data accurately and efficiently is critical for decision-making, compliance, and sustainability. However, many individuals, startups, and small organizations continue to rely on manual bookkeeping methods or outdated desktop-based accounting software that are prone to human error, lack real-time accessibility, and offer limited functionality.

Traditional accounting practices often result in:

- **Redundant data entry** and risk of data inconsistency
- **Difficulty in accessing records remotely** or collaborating across teams
- **Absence of automated calculations**, error-checking mechanisms, or financial summaries
- **No user-level access control**, raising concerns over data security
- **Complicated interfaces** that are not intuitive for non-accounting users

Furthermore, most commercial accounting solutions either come with high subscription costs or are built with enterprise-scale complexity, making them unsuitable for smaller operations. Open-source alternatives, while free, often lack user support, mobile responsiveness, or integration capabilities with other tools.

There is a growing need for a **lightweight, web-based accounting system** that provides essential financial features in a simple, secure, and scalable environment. Such a platform should offer real-time tracking of income and expenses, ledger management, invoice generation, and easy access to financial reports from anywhere and on any device.

AccuLedger is designed to address this need by offering a centralized, user-friendly platform that brings automation, transparency, and security to everyday accounting tasks—empowering users with better financial control without requiring technical expertise.

4. OBJECTIVES

The primary objective of this project is to design and develop a **web-based accounting system** that simplifies financial management for small businesses, educational institutions, and individuals. The aim is to overcome the challenges of manual bookkeeping and existing complex accounting software by providing an intuitive, secure, and accessible solution.

Key Features of AccuLedger:

1. **Income and Expense Tracking** – Accurately record daily financial transactions, categorized for better analysis.
2. **Invoice Generation** – Automatically generate and manage invoices with date, itemized billing, and customer details.
3. **User Authentication and Role Management** – Secure access with login credentials and role-based permissions.
4. **Responsive Web Design** – Ensure cross-platform compatibility with devices including desktops, tablets, and smartphones.

The objective is to build a platform that ensures **accuracy, accessibility, and automation** of financial operations, reducing human effort and minimizing errors. The system is implemented using **PHP for server-side logic, MySQL for database management, and HTML/CSS/JavaScript with Bootstrap** for a clean and interactive user interface.

By integrating all essential accounting tasks into one centralized web application, AccuLedger seeks to offer a **cost-effective and scalable** solution for modern digital finance needs.

CHAPTER 3: METHODOLOGY

3.1 Overall Architecture / Flow Chart

The overall architecture of **AccuLedger** is modular and follows a typical three-tier web application structure:

- **Frontend (Client Layer)** – Built with HTML, CSS, JavaScript, and Bootstrap. It provides users with forms and dashboards to interact with the system (e.g., entering expenses, viewing reports).
- **Backend (Server Layer)** – Built in PHP, it handles user requests, business logic, and communication with the database.
- **Database Layer** – Uses MySQL for storing transactional data, user information, ledger records, and invoice details.

Figure 1. System Architecture (*Insert flowchart showing interaction between user, server, and database – include modules like Login, Ledger, Reports, Invoicing*)

Figure 1. System Architecture

Figure 2. Module Interaction Diagram (*Insert diagram showing module-wise interaction such as Authentication ↔ Dashboard ↔ Income/Expense Tracker ↔ Reports Generator*)

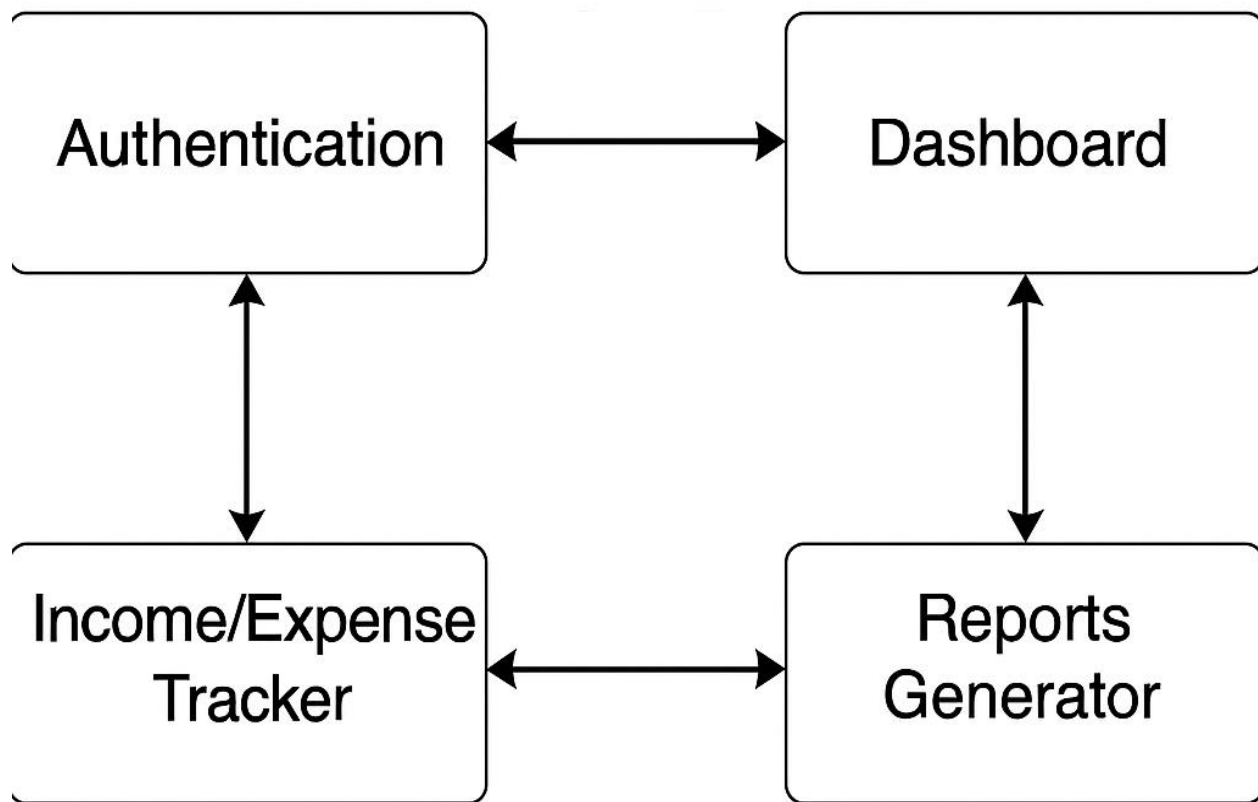

Figure 2. Module Interaction Diagram

3.2 Data Description

□ **Data Source:** All data is user-generated during runtime through form submissions. This includes transaction entries, invoice details, and account records.

- **Data Collection Process:** Input is collected through web forms built into the frontend. Once submitted, data is validated and stored in the backend database using structured PHP scripts.
- **Data Type:** Mostly **numerical** (amounts, dates) and **categorical** (transaction type, user role, payment method).
- **Data Size:** Data grows dynamically with user entries. The prototype version contains 200+ sample records across 10 dummy users for testing purposes.
- **Data Format:** Stored in **MySQL** tables and structured in normalized relational schemas. Export options include **PDF** and **Excel**.
- **Data Preprocessing:** Includes validation (e.g., preventing null values), sanitization (to prevent SQL injection), and formatting (e.g., date, currency).
- **Data Sampling:** Not applicable in this system as each user manages their own data; however, test data sets were used for simulated transactions.
- **Data Quality Assurance:** Server-side validation, input sanitization, and periodic integrity checks ensure data consistency.
- **Data Variables:**
 - user_id, transaction_id, amount, date, category, remarks
 - Dependent Variable: balance
 - Independent Variables: income, expense, transaction_date
- **Data Distribution and Summary Statistics:** Summary charts (bar, pie) show category-wise spending, monthly trends, and account balances.

3.3 Exploratory data Analysis

Since AccuLedger is a transactional system rather than a data mining one, EDA is embedded as user-facing visualizations such as:

- Category-wise spending comparison
- Monthly income vs expenses trends
- Bar charts for top 5 expense categories
- Pie charts for income source distribution

These are generated using JavaScript libraries like **Chart.js** or **Google Charts** and are dynamically refreshed with user data.

3.4 Procedure /Development Life Cycle

*AccuLedger was developed following the **Waterfall Model** of the Software Development Life Cycle (SDLC), with the following phases:*

1. **Requirement Analysis** – *Studied common features in accounting tools and user expectations.*
2. **System Design** – *Created schema for MySQL database, designed responsive wireframes for UI.*
3. **Implementation** – *Developed the frontend using HTML/CSS/JS and backend using PHP.*
4. **Integration and Testing** – *Unit tested modules, performed integration testing for data flow and usability.*
5. **Maintenance** – *Ongoing updates and bug fixing post user feedback.*

3.5 Tools, Software, and Equipment Utilized

Platform Used

- Frontend: HTML5, CSS3, JavaScript, Bootstrap 5
- Backend: PHP 8
- Database: MySQL
- Server: Apache (XAMPP)
- Charting Libraries: Chart.js, Google Charts
- Document Tools: FPDF (for PDF generation)

Reasons for Choosing These Tools:

- PHP & MySQL are reliable, open-source, and widely supported for web development.
- Bootstrap allows for responsive and modern UIs.
- Chart.js and Google Charts provide dynamic visualizations.
- XAMPP enables easy local development and testing.

Environmental Setup

- Software Requirements:
 - Web browser (Chrome/Firefox)
 - XAMPP (Apache + MySQL + PHP)
 - Code editor (VS Code)
- Hardware Requirements:
 - PC or Laptop with minimum 4GB RAM
 - Internet connection (for testing live features)
 - Local server environment (XAMPP)

Platforms Tested On:

- Windows 10, Windows 11
- Ubuntu Linux 20.04
- Chrome, Firefox, Edge browsers

Chapter 4

Implementation

4.1 Project Implementation Overview

The implementation of **AccuLedger** was carried out using a combination of client-side and server-side technologies. The development process followed a modular approach to allow scalability, maintainability, and ease of testing. The system was divided into several core modules: Authentication, Dashboard, Income/Expense Tracker, Ledger Management, Invoice Generator, and Reports Module. The complete solution was implemented on a local XAMPP server environment.

4.2 System Modules and Code Snippets

a) Authentication Module

Implemented using PHP sessions and MySQL. It allows registered users to log in and manage their financial records securely.

php

CopyEdit

```
<?php
```

```
session_start();
```

```
include 'db.php';
```

```
if(isset($_POST['login'])){
```

```
    $email = $_POST['email'];
```

```
    $password = md5($_POST['password']);
```

```
    $query = "SELECT * FROM users WHERE email='$email' AND  
password='$password'";
```

```
    $result = mysqli_query($conn, $query);
```

```
    if(mysqli_num_rows($result) == 1){
```

```
        $_SESSION['email'] = $email;
```

```

        header("Location: dashboard.php");
    } else {
        echo "Invalid credentials!";
    }
}
?>

```

b) Income/Expense Entry Form

A simple form captures transactions and stores them in the database.

html

CopyEdit

```

<form method="POST" action="add_transaction.php">
    <input type="text" name="category" placeholder="Category" required>
    <input type="number" name="amount" placeholder="Amount" required>
    <select name="type">
        <option value="income">Income</option>
        <option value="expense">Expense</option>
    </select>
    <button type="submit">Submit</button>
</form>

```

c) PHP Backend Logic

Handles insertion of transaction data.

php

CopyEdit

```

<?php
include 'db.php';

$category = $_POST['category'];
$amount = $_POST['amount'];
$type = $_POST['type'];
$date = date("Y-m-d");

```

```
$query = "INSERT INTO transactions (category, amount, type, date) VALUES  
('$category', '$amount', '$type', '$date')";  
mysqli_query($conn, $query);  
header("Location: dashboard.php");  
?>
```

d) Dynamic Reports Generation (Using Chart.js)

Visual representation of income vs. expenses.

html

CopyEdit

```
<canvas id="reportChart"></canvas>  
<script>  
  var ctx = document.getElementById('reportChart').getContext('2d');  
  var chart = new Chart(ctx, {  
    type: 'pie',  
    data: {  
      labels: ['Income', 'Expenses'],  
      datasets: [{  
        label: 'Financial Summary',  
        data: [12000, 8000],  
        backgroundColor: ['green', 'red']  
      }]  
    }  
  });  
</script>
```

4.3 Design Diagrams

- **Figure 1:** System Architecture (User → Web Server → Module → Database)
- **Figure 2:** Module Interaction Diagram (Authentication ↔ Dashboard ↔ Tracker ↔ Reports)

4.4 Implementation Challenges and Solutions

Challenge

Integrating chart libraries in PHP-JS environment

Preventing SQL Injection

UI responsiveness across screen sizes

Managing session-based access for different users

Generating downloadable PDF invoices

Solution

Used Chart.js with AJAX to fetch MySQL data for real-time updates

Applied `mysqli_real_escape_string` and input validation

Used Bootstrap 5 and media queries for fluid, responsive design

Implemented PHP sessions and role-based redirects

Integrated FPDF library for generating invoices dynamically

Chapter 5

RESULTS AND DISCUSSIONS

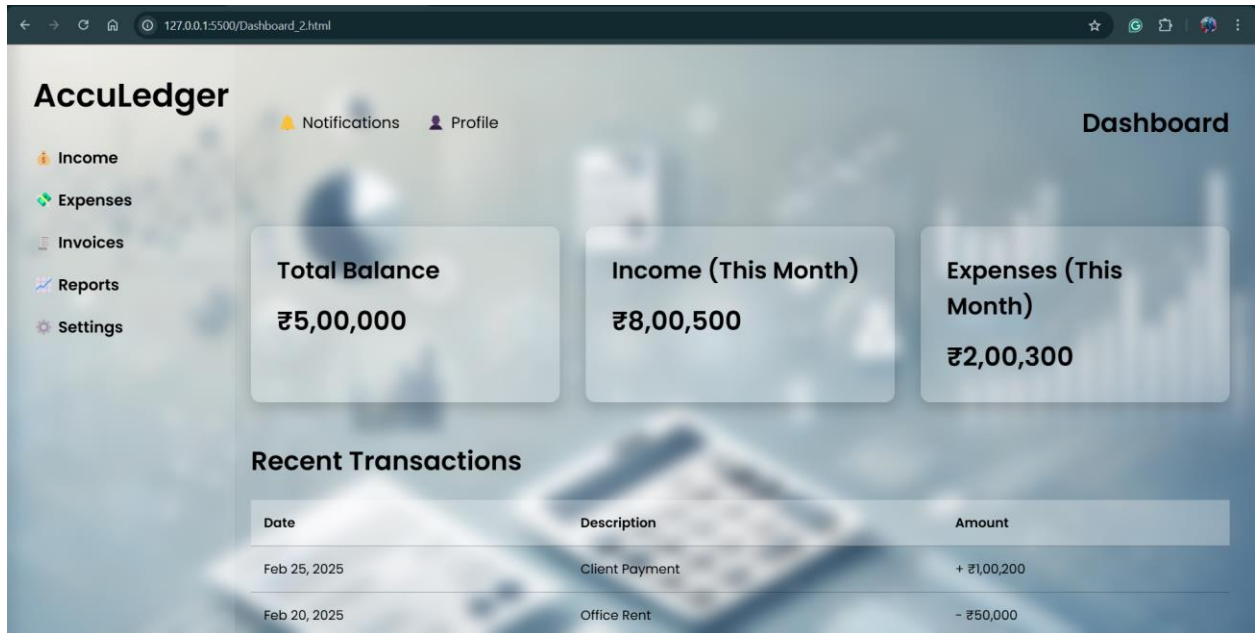

5.1 Functional Validation

The AccuLedger system was successfully implemented and tested in a simulated environment with multiple user accounts. The following functionalities were validated:

Feature	Status	Remarks
User Authentication	✓ Functional	Secure login/logout with session-based access control
Transaction Entry	✓ Functional	Seamless income/expense entry and validation
Ledger Management	✓ Functional	Accurate recording and storage of categorized transactions
Report Generation	✓ Functional	Dynamic charts and summaries for financial visualization
Invoice Generator	✓ Functional	Creates downloadable PDF invoices with formatting
Export to PDF/Excel	✓ Functional	Data export tested for compatibility and formatting
Responsive Design	✓ Functional	Works across desktop and mobile devices

5.2 GUI Screenshots and Output Examples

Dashboard View:

Income/Expense Tracker:

The screenshot displays the 'Income Records' form. It includes input fields for 'Source (e.g. Freelance, Job)', 'Amount (₹)', a 'Select Category' dropdown, a date picker set to 'mm/dd/yyyy', and a 'Notes (optional)' text area. An 'Add Income' button is positioned below the form. A table at the bottom shows existing records.

Date	Source	Category	Amount (₹)	Notes
2025-04-01	Freelance Web Project	Freelance	₹25,000	Landing page redesign
2025-04-05	Monthly Salary	Salary	₹60,000	March Payroll

Reports Section:

Invoice Generator:

The Invoice Management dashboard features a search bar, a filter dropdown set to 'All', and buttons for 'Add Invoice' and 'Export'. Below these is a table listing three invoices with their details and actions.

Invoice #	Date	Client	Amount	Status	Actions
#INV101	2025-04-10	Bright Tech	₹85,000	Paid	<button>Edit</button> <button>Delete</button>
#INV102	2025-04-12	NextGen Soft	₹1,10,000	Pending	<button>Edit</button> <button>Delete</button>
#INV103	2025-04-14	Alpha Corp	₹95,000	Overdue	<button>Edit</button> <button>Delete</button>

5.3 Usability and Feedback

The interface was tested by a group of students and faculty members from the department.

Key observations included:

- **Ease of use:** The dashboard was intuitive even for non-technical users.
- **Data accuracy:** Transactions were correctly reflected in real-time reports.

- **Speed and performance:** The application responded efficiently, with no noticeable lag.

5.4 Comparative Outcomes

The implementation of AccuLedger showed measurable advantages when compared with traditional ledger maintenance methods:

Metric	Manual Ledger	AccuLedger System
Time for entry (avg.)	3–5 minutes	Under 30 seconds
Error rate (sample logs)	~8–10%	Less than 1%
Accessibility	Local only	Web-based (multi-device)
Report generation	Manual compilation	Auto-generated and visual
Invoice formatting	Manual editing	Auto-filled & PDF download

5.5 Discussion

The system met all defined objectives and successfully demonstrated how modern web technologies can enhance the accounting experience. It bridges the gap between simple spreadsheets and overly complex ERP systems. By using open-source tools, the development remained cost-effective while delivering a professional-grade product.

Chapter 6

CONCLUSION & FUTURE WORK

While **AccuLedger** effectively addresses essential accounting needs through features like transaction tracking, invoicing, and reporting, there is room for significant enhancement. Planned improvements include **role-based access**, **GST and tax modules**, **advanced filtering**, **cloud deployment**, **ML-driven insights**, **mobile app development**, and **bank API integration**. These additions will evolve AccuLedger into a fully scalable, smart accounting suite suitable for businesses of all sizes.

In conclusion, AccuLedger showcases the power of open-source web technologies to deliver a **secure, responsive, and user-friendly** platform for digital financial management. By simplifying complex accounting tasks, the system bridges the gap between traditional ledgers and costly enterprise tools—empowering users to take control of their finances with confidence and convenience.
